MaxCut is hard when restricted to geometric intersection model graph classes

Celina Miraglia Herrera de Figueiredo

CLAIO 2022

Based on

Maximum cut on interval graphs of interval count four is NP-complete with Alexsander A. de Melo, Fabiano S. Oliveira, Ana Silva arxiv.org/abs/2012.09804

MaxCut on Permutation Graphs is NP-complete

with Alexsander A. de Melo, Fabiano S. Oliveira, Ana Silva arxiv.org/abs/2202.13955

The Guide – Computers and Intractability

"Despite that 23 years have passed since its publication, I consider Garey and Johnson the single most important book on my office bookshelf. Every computer scientist should have this book on their shelves as well. NP-completeness is the single most important concept to come out of theoretical computer science and no book covers it as well as Garey and Johnson."

Lance Fortnow, "Great Books: Computers and Intractability: A Guide to the Theory of NP-Completeness"

Ongoing Guide – Graph Restrictions and Their Effect

Containment relations for classes

Given a graph G and $k \in \mathbb{Z}_0^+$, MAXCUT asks whether

$$\mathrm{mc}(G) = \max_{[A,B]} |E_G(A,B)| \ge k.$$

Classical NP-complete problem

(Garey, Johnson, Stockmeyer, 1976).

The key gadget to the NP-completeness

An (x, y)-grained gadget is a split graph H(K, S), such that

$$\blacktriangleright N_H(K'') = K \cup S''.$$

Possible intersections with a grained gadget

A graph *G* respects the structure of *H* if, $\forall u \in V(G) \setminus V(H)$, $N_G(v) \cap V(H) = \emptyset$ or *u* satisfies

Strong intersection

Let G be a graph and [A, B] be a maximum cut of G.

If G respects the structure of an (x, y)-grained gadget H, then, for suitable x and y,

- either H is A-partitioned by [A, B];
- or H is B-partitioned by [A, B].

Adhikary, Bose, Mukherjee, and Roy's reduction

Polynomial-time reduction from MaxCut on cubic graphs.

Let G be a cubic graph, $\pi_V = (u_1, \ldots, u_n)$ and $\pi_E = (e_1, \ldots, e_m)$.

For suitable x, y, $mc(\mathbb{G}_{\mathcal{M}}) \ge \phi(n, k)$ iff $mc(G) \ge k$.

(Complexity of maximum cut on interval graphs. Adhikary, Bose, Mukherjee, Roy, 2021)

Our reduction: Interval count 4

[A, B] is a max-cut of $\mathbb{G}_{\mathcal{M}}$

Our reduction: Permutation

[A,B] is a max-cut of $\mathbb{G}_{\mathcal{M}}$
